

As a client, I would like to purchase Django card shop, a web-based system designed to help users manage information easily and securely. The system includes user accounts, secure login, and a dashboard for viewing and updating data.

The total cost for Django card shop is \$2,500. Payment will be split into two parts: 50% upfront and 50% after the project is completed.

Any bugs found within 30 days of delivery will be fixed at no extra cost. Additional features or changes requested after that period may require an additional fee.

Functionalities include:

The ability to purchase cards

The ability to create and login to an account

The ability to contact the owner of the shop through the contact page either by email or phone number

The ability to add and remove cards that are added or sold
